

Boeing Business Jets Offers Customers More Comfortable Cabin Altitude

Boeing Business Jets Offers Customers More Comfortable Cabin Altitude

Boeing Business Jet (BBJ) operators now have the option to lower cabin altitude from the standard 8,000-foot cabin to 6,500 feet, improving passenger comfort. The lower cabin altitude feature, available in early 2003, will be sold as a kit that can be installed after delivery of a green airplane or as a retrofit on in-service BBJs.

Boeing Business Jets was launched in 1996 as a joint venture between Boeing and General Electric. Designed for corporate and VIP applications, the Boeing Business Jet is a high-performance derivative of the Next-Generation 737-700.
