Boeing Making Solid Progress on 787 Dreamliner

Boeing and its international team of partners are making solid progress on the continued development and start of production of the all-new Boeing 787 Dreamliner.

Scheduled for delivery beginning in 2008, the Dreamliner provides passengers with a better flying experience and operators with a more efficient commercial jetliner. Because it uses 20 percent less fuel per passenger than similarly sized airplanes, the 787 is designed for the environment with lower emissions and quieter takeoffs and landings. Inside the airplane, passengers will find cleaner air, bigger windows, more stowage space and improved lighting. To date, 28 airlines have logged 403 orders and commitments worth more than $55 billion at current list prices since the 787 launch in April 2004, making the Dreamliner the most successful commercial airplane launch in history.
