

Boeing-NATO PROJECT X Challenge Spurs Innovative Ideas for Future Autonomous Capabilities

VALKENBURG, June 6, 2022— The joint Boeing – NATO PROJECT X innovation challenge has generated new ideas for autonomous systems to reach inaccessible locations and improve situation awareness. This three-month-long intense rapid-prototyping competition allowed innovators from Dutch universities, including the Technical University of Delft, the opportunity to propose new approaches to supporting the Alliance's most pressing needs.

Robert Weaver, deputy assistant secretary general for Defence Investment at NATO, highlighted the importance of autonomy and its digital enablers in areas such as data and artificial intelligence. "Project X sets a benchmark for new and creative ways to engage academia and industry and help Allies develop and adopt emerging technologies at the speed of relevance," said Weaver.

"This project is a fantastic example of the great potential within such public-private partnerships and the speed of innovation we can achieve if we inspire young innovators to apply a unique and creative approach to tackling tomorrow's challenges," said Kim Stollar, managing director, EU & NATO Government Affairs at Boeing International. "We all agree that there is a bright future ahead of all of the PROJECT X participants."

The two competing PROJECT X teams presented their concepts at an event in May hosted by Unmanned Valley, an autonomous technology incubator in Valkenburg, Netherlands.

"Surrounded by the leading experts from NATO, Boeing, and an incredible team, PROJECT X has given me the opportunity to finally put theory into practice, which resulted in a highly fruitful and rewarding experience that opened up a new range of opportunities," said Dennis van Eck van der Sluijs during his team's final presentation.

Different approaches

Supported by experts from both Boeing and NATO, the two teams, Monarch and Alpha, took two very different approaches.

Team Monarch's concept consists of a hierarchical model of specialized unmanned aerial vehicles (UAVs) that can autonomously survey hazardous areas, evaluate risks and prioritize drone positioning. The drones' three-level network structure facilitates an accurate assessment of dynamically changing environments. This makes the concept suitable for many applications including search and rescue, disaster management, surveillance and target detection.

Team Alpha on the other hand designed a multi-agent drone system that incentivizes UAVs to explore, identify, verify, and resolve targets of interest. The drones prioritize targets to complete the mission in the most efficient way by utilizing the presence of multiple intelligent assets and realizing the concept of egoistic altruism in machines.

Team Alpha's concept was named winner of the PROJECT X design competition after deliberation from the jury of experts from Boeing, NATO and Unmanned Valley.

PROJECT X is a unique public-private partnership between NATO, Boeing, the Government of the Netherlands, and Dutch industry, developed as part of Boeing's Industrial Participation program in the Netherlands, with the support of the Dutch Ministries of Defence and Economic Affairs and Climate Policy. It is exemplary of Boeing's commitment to fostering an ever stronger industrial and innovation partnership with the Netherlands, NATO and other Allied countries across Europe.

As a leading global aerospace company, Boeing develops, manufactures and services commercial airplanes, defense products and space systems for customers in more than 150 countries. The company leverages the talents of a global supplier base to advance economic opportunity, sustainability and community impact. Boeing's diverse team is committed to innovating for the future, leading with sustainability, and cultivating a culture based on the company's core values of safety, quality and integrity.
